CALVADOS–COMPLEX

step 1: add PDB file with complex

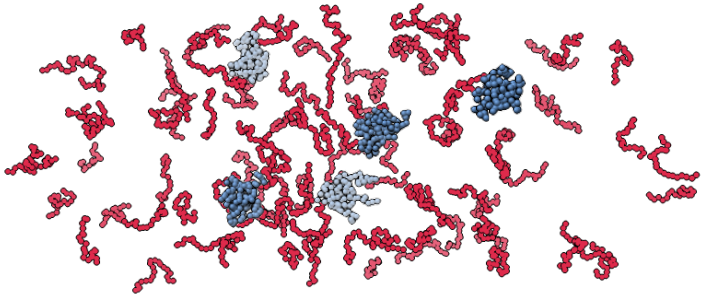

Individual components are automatically recognized as being part of a protein, RNA, or DNA.

step 2: define interaction strength between components

A global interaction strength can be set, or individual values per component. Contacts are determined via a cutoff or user definition

step 3: add N copies of the complex or M copies of specific components

Each protein is a unique component and can have unique definition of folded domain(s)
